...the squirrel's bushy tail is not just for show. It helps the squirrel keep its balance when it jumps from one tree to another. It also helps to keep the squirrel warm in the winter. The squirrel's tail is made up of many layers of hair. This makes it very soft and fluffy. The squirrel's tail is also very long. It can be as long as the squirrel's body. This makes it easy for the squirrel to hold its tail up in the air. The squirrel's tail is also very flexible. It can curl up and down. This makes it easy for the squirrel to use its tail as a seat. The squirrel's tail is also very strong. It can support the weight of the squirrel's body. This makes it easy for the squirrel to sit on its tail for long periods of time. The squirrel's tail is also very useful for other things. For example, the squirrel can use its tail to help it climb trees. It can also use its tail to help it dig for food. The squirrel's tail is truly a remarkable piece of nature's machinery.

This little guy enjoys the outdoors with a meaningful purpose that I hope you will appreciate. It is so much that the details of the leaves that I find in forest.

This is the place where we, squirrels, like to gather and play. We are part of the wild animal family called rodent. The most common species of squirrel in North America is the red squirrel. There are more than 30 species of squirrel on our planet.

Let me tell you a little bit more about myself. I'm very curious. I have a fluffy tail and, since I like to play, I'll jump from one tree to another, reaching across the branches. Not to mention it also helps me swing when I sleep! Well, the ones in the red squirrel family can also swim, so we are safe if the Autumn Creek happens to spill its banks from rain or melting snow. You also need to know that we change our fur twice a year. In the summer, we have a thin layer and in the winter, a thicker, much darker layer. Take a good look at me if I'm a different color than the one in a book, you may not recognize me. But I will definitely remember you!
